Universal Push Notification Service Oct 22 2022 Push notifications have been an important feature in the computing services world. They have been one of the most requested cloud services and have been widely implemented in mobile phones, tablets and personal computers. In spite of them being used so extensively, the framework required to make them work is still quite complex and largely unrelated to the logic of the app. Today, app developers who target multiple platforms need a separate data provider for each type of device since they all use different protocols. They need to manage different types of notification systems and interface with their respective protocols in order to push messages. This means that app developers need to do unnecessary work in order to implement even common scenarios. These scenarios could be related to broadcasting, tiling or sending toast notifications to segmented users. In this paper, I propose the Universal Push Notification Service which eliminates the complexity of setting up push notifications. The service provides APIs that deliver messages across multiple platforms like iOS, Android and Windows. It requires no setting up. The APIs provide a registration service to register all applications and provide a push service to relay notifications to different devices. We shall make use of the notification hubs in order to setup the infrastructure. Notification hubs use a full cross-platform push notification infrastructure, and appreciably reduce the notification specific code that runs in the app backend. Devices are only responsible for registering the platform native notification handles, and the backend takes the responsibility for sending platform specific messages to users or interest groups.

Pushed to the Edge Nov 23 2022 Mobile phone push notifications are simultaneously one of the most prevalent media forms and one of the least critically considered. This thesis argues for a deeper look at the push notification with a critical eye for what sociocultural impacts and influences this form can have by grounding it within a cultural historiography of opaque computing and notificatory machines. By performing autoethnographic methods on my iPhone and the notifications that I receive, I introduce new valences for the push notification that extend beyond the screen of the phone. I examine three flavors of particularly prevalent notifications that have the ability to transform the ‘user’ into a ‘user hyphenate,’ whether this be through disrupting a user-player’s daily life with an in-game message, playing with a candidate’s identity to encourage campaign contributions for the user-voter, or changing the way that the user-inhabitant sees the neighborhood around them through messages sent by geolocalized social network platforms Nextdoor and Ring Neighbors. This thesis introduces a series of methods for closely reading individual notifications, chronologically grounding collections of notifications reading their ‘notificatory flows,’ and considering the narratives they tell us about the places around us through their ‘notifications.’ Most importantly, this thesis calls for more critical consideration of a notificatory future

Push Notifications by Tutorials (Fourth Edition) Jan 25 2023 Learn iOS Push Notifications!Push

Notifications are one of the most important interaction points of your app with your users. Simply put, a push notification is a way to send any type of data to your users' apps, even if they aren't actively using them. Even though most developers feel they know everything there is to know about this topic, major additions in latest releases of iOS have pushed these notifications beyond simply delivering messages to your users. Learning all of the exciting opportunities and ways you could boost your users' experiences and interactions might be a bit overwhelming at first. Who This Book Is For This book is for intermediate iOS developers who already know the basics of iOS. It starts with a basic introduction of how notifications work, with later chapters going much deeper into advanced materials. Topics Covered Remote Notification Payload: Learn everything there is to know about the Payload representing your notification and its various customization options. Remote Notifications: Learn everything about how to send a remote notification from a server, how to create your own Vapor-based push server, identify and manage users and their device tokens, and more. Local Notifications: Much like remote notifications, you'll learn how to schedule local notifications, originating from your device instead of from a remote server. Modifying the Payload: Learn how to use a Notification Service Extension to manipulate your notification payload right before it's presented to the user. Custom Actions: Put your users first by providing them with useful Custom Actions they can interact

with, right from your notification, without the need to open your app. Custom Interfaces: Take your notifications to the next level by providing a rich, customized user interface for your push notification. All kinds of other topics related to push notifications on iOS, iPadOS and watchOS! One thing you can count on: After you finish reading this book, you'll master everything there is to know about push notifications and how to take advantage of the latest and greatest features, to make your app stand out from the rest to enhance your user experience.

**Intelligent Notification Systems** Jun 25 2020 Notifications provide a unique mechanism for increasing the effectiveness of real-time information delivery systems. However, notifications that demand users' attention at inopportune moments are more likely to have adverse effects and might become a cause of potential disruption rather than proving beneficial to users. In order to address these challenges a variety of intelligent notification mechanisms based on monitoring and learning users' behavior have been proposed. The goal of such mechanisms is maximizing users' receptivity to the delivered information by automatically inferring the right time and the right context for sending a certain type of information. This book presents an overview of the current state of the art in the area of intelligent notification mechanisms that rely on the awareness of users' context and preferences. We first present a survey of studies focusing on understanding and modeling users' interruptibility and receptivity to notifications from desktops and mobile devices. Then, we discuss the existing challenges and opportunities in developing mechanisms for intelligent notification systems in a variety of application scenarios.

It presents a technical framework and testbed as an approach for evaluating the usage of mobile applications and notifications, and then discusses a series of studies based on this framework that investigate factors influencing users' perceptions of mobile notifications. Lastly, a set of design guidelines for the usage of mobile notifications is derived that can be employed to support users in handling notifications on smartphones.
